Proposals.

PROPOSALS FOR STEAM MACHINERY FOR THE UNITED STATES NAVY.—The Navy Department will, on the 20th day of July, receive sealed proposals for the construction of steam machinery for vessels to be propelled by two screws acting independently of each other.

There will be, for each vessel, two pairs of engines of the same construction and detail as those built for the U. S. screw gunboats, with the exception of the length of stroke, which will be 21 inches, instead of 18 inches, of the gunboat of which the screw will be 10 feet in diameter, and the shaft 10 feet long.

Waddington's site. These, and some trifling modifications in the detail, are all the engines will vary from the specifications of these of the gunboat above referred to.

Each pair of engines will be triplex direct, and operate its screw propeller through a gear train, consisting of four 4-foot pitch, not less than 10 feet diameter; they will be sustained from the counter of the vessel by a brass bearing, and the shaft will revolve in a brass pipe connecting the engine with the propeller.

The machinery will be of the vertical water-tube type, with the tubes above the furnaces. The grate surface will not exceed 300 square feet, and the heating-surface not less than 7,500 square feet. The boiler pressure will be 150 lbs. per square inch, and the temperature of the water 210° Fahr., so far as quality and kind of workmanship, thickness of metal, &c., are concerned; all appendages to be the same, regard had to the increased dimensions of the boilers.

The machinery will be erected in the vessels at the different yards of Kittery, Maine; Cheverieftown, Massachusetts; New York and Philadelphia. The proposals will state the name or names of the navy-yards at which the machinery is to be constructed, and the date when it will be delivered, and the time of delivery, and the date when the machinery will be ready for steam.

The machinery will be of the vertical water-tube type, with the tubes above the furnaces. The grate surface will not exceed 300 square feet, and the heating-surface not less than 7,500 square feet, and the boiler pressure will be 150 lbs. per square inch, and the temperature of the water 210° Fahr., so far as quality and kind of workmanship, thickness of metal, &c., are concerned; all appendages to be the same, regard had to the increased dimensions of the boilers.
